### DETAILED ACTION

1. This application has been examined.
2. Claim 1 is now pending.

### *Claim Rejections - 35 USC § 102*

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

4. Claim 1 is rejected under 35 U.S.C. 102(e) as being anticipated by Bestavros et al. (U.S. Patent Number 6,370,584), hereinafter referred to as Bestavros.

5. Bestavros has disclosed:

- <Claim 1>

A method of selecting an optimal routing path for internet data comprising the steps of:  
generating a request at a client (column 3, lines 3-13); analyzing said request in  
accordance with at least one rule set (column 3, lines 17-54); and routing said request to a  
server for fulfillment of said request based on the results of said analysis (column 3, lines  
42-54).

Since all the limitations of the invention as set forth in claim 1 have been disclosed by Bestavros, claim 1 is rejected.

*Conclusion*

6. The prior art made of record and not relied upon is considered pertinent to the applicant's disclosure.

- Colby et al. (U.S. Patent Number 6,006,264) disclosed a flow switch that intercepts a client content request in an IP network and directs it to a best-fit server.
- Gifford (U.S. Patent Number 6,052,718) disclosed a method for automatically directing a client computer that requests a service to a server replica for that service.
- Yu (U.S. Patent Number 6,351,775) disclosed a method for the dynamic routing of object requests among a cluster of servers that factors load balancing and caching efficiency.
- Cohen et al. (U.S. Patent Number 6,389,462) disclosed a method for transparently directing requests for web objects to proxy caches.
- Emens et al. (U.S. Patent Number 6,606,643) disclosed a method for selecting a particular mirror server that replicates a host server that provides web content over the Internet.
